

What is Health Screening?

Health Screening is the process of detecting diseases or medical conditions in healthy people. Health screening involves consultation with a medical professional followed by laboratory, radiology and other tests.

Why Health Screening?

Health screening aims to detect diseases and medical conditions at an early stage, so as to allow early intervention which can give better outcomes.

Who requires Health Screening?

Health screening is individualised to the risk factors of each person. The tests you need depend on your age, gender, family history and whether you have risk factors for certain diseases. At Parkway Shenton, we offer a wide range of health screening packages that are affordable and tailored to your individual needs. Please speak to your doctor to determine the most appropriate health screening package for you.

For more information on our health screening packages, kindly consult our doctors at these Parkway Shenton Clinics.
